Diversion features a simple to use shell script user interface, packed full of useful info's and the current application state.

These are some of the features, with the screenshots showing the standard and extended o main menu structure:

- Blocking Ads on router level, blocks Ads on all devices in your LAN
- Five preset blocking file types to choose from
- Customize any of the preset blocking file types
- Auto-updates the blocking file weekly
- Toggle Ad-blocking on or off in seconds
- Supports a whitelist for domains you don't want blocked
- Supports a blacklist and wildcard-blacklist for individual domains to be blocked that are not covered by the blocking file
- Built in smart Editor for white- and blacklist editing
- Toggle Dnsmasq logging on or off in seconds
- Follow the Dnsmasq log file with five options
- Supports http and https ad blocking
- Installs Entware and pixelserv-tls (Diversion Standard), fully integrated management interface
- Instant or automated detailed weekly usage stats
- Adds diversion to system PATH
  (start Diversion from anywhere with diversion)
- Keeps a history of your terminal commands
- Built in update function to update itself to the latest version
- Supports IPv6 blocking and is automatically used when active
- Eleven theme colors to choose from
- Uninstall function

And more features are added with each Diversion update.
